

# Stratapac™ – an intelligent packaging system.

Inner ply extruded of raw material as per FDA and LMBG. For pharmaceutical products under clean room conditions as per DIN EN ISO 14644-1, class 5. Barrier films with PA/EVOH can also be used as inliner.

The outer ply is being coextruded following the individual demands regarding the colouring and the material. Possibility of flexographic printing up to 8 colours.

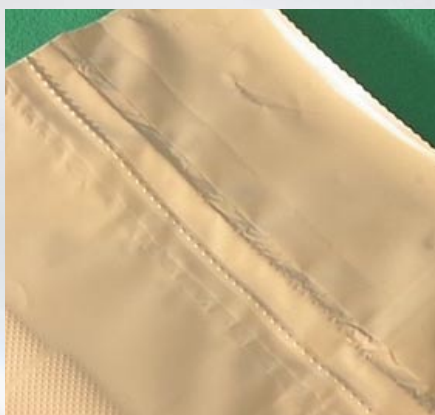

In accordance to the filling product and the bulk density, the bag is manufactured on a special machine within the dimensions from 400x600+120 to 600x950+200 mm.

After the filling process the bag is closed by a patented combination of sealing and perforation.

Sealing and perforation are constructed in a way that the bags withstand the palletising pressure. The embossment guarantees the ability of palletising the bags.

The production process is accompanied by the quality assurance in order to guarantee a constant high quality standard. Modern laboratory and examination equipment is at disposition.

The customer can open the bag easily without any technical means. The exterior packaging can be removed and recycled.

The absolutely clean internal packaging (including the filling good) is being taken out. After passing a lock, the product is at disposal for a completely hygienic process.
